# SE Lab 2: Agile Backlog Creation & Sprint Simulation in Jira

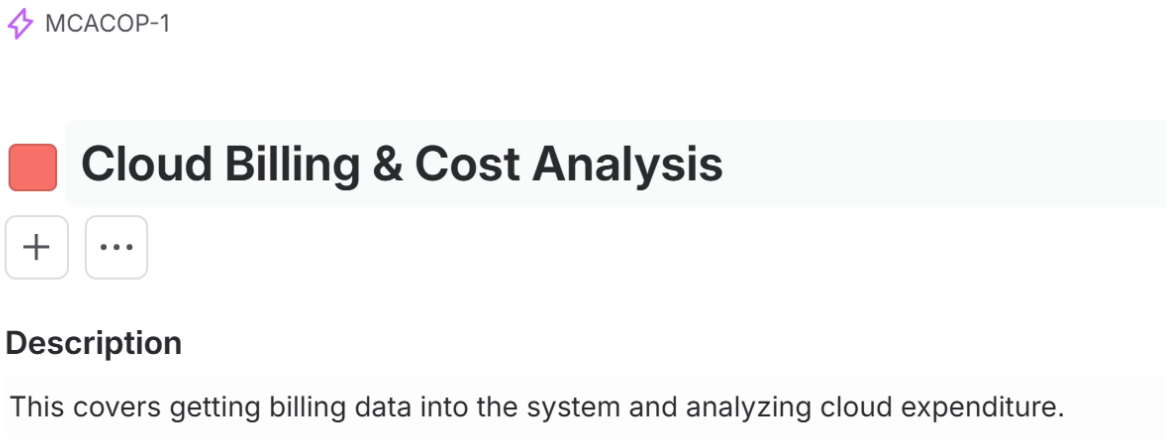

## SRN: PES1UG24AM345

## Name: Ashvin Ronald Lobo

## Class: AIML F

## Deliverables:

## Epics:

MCACOP-2

## Resource Optimization

### Description

This covers finding waste such as idle compute and unattached storage.

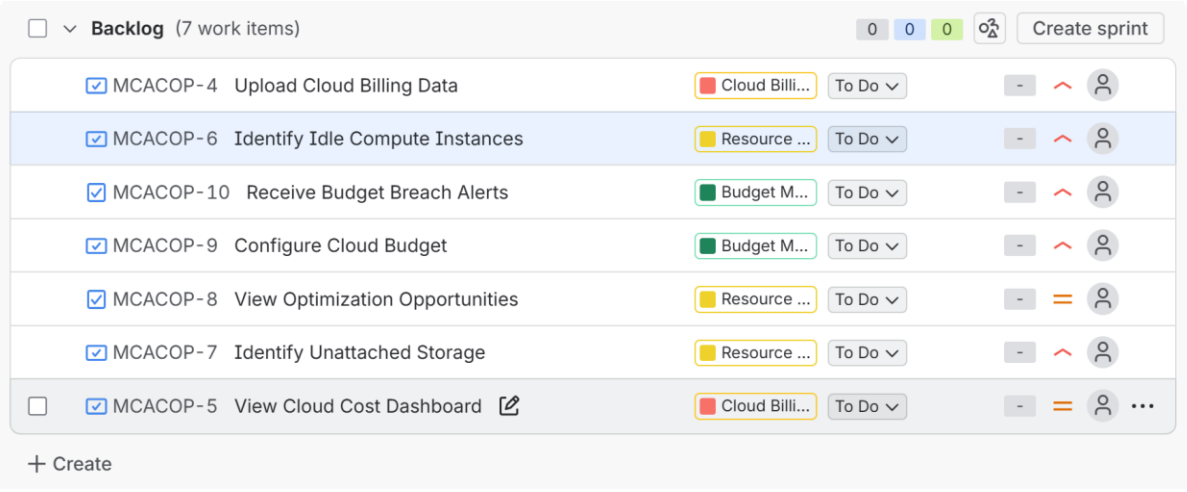

MCACOP-3

## Budget Monitoring & Alerts

### Description

This covers budget monitoring and notifications.

# User Stories:

MCACOP-1 /
MCACOP-4

1

# Upload Cloud Billing Data

To Do

## Description

As a FinOps Analyst,
I want to upload AWS, Azure, and GCP billing CSV files,
so that the portal can process and analyze my cloud expenditure.

MCACOP-1 /
MCACOP-5

1

# View Cloud Cost Dashboard

To Do

## Description

As a FinOps Analyst,
I want to view cloud costs categorized by provider, service, and project tag,
so that I can understand where my organization's cloud expenditure is going.

MCACOP-2 /
MCACOP-6

1

# Identify Idle Compute Instances

To Do

## Description

As a FinOps Analyst,
I want the portal to identify compute instances with less than 5% CPU utilization over 14 days, so that I can identify potentially unnecessary compute costs.

MCACOP-2 /
MCACOP-7

1

# Identify Unattached Storage

To Do

## Description

As a FinOps Analyst,
I want the portal to identify unattached cloud storage volumes,
so that I can find storage resources that are generating unnecessary costs.

MCACOP-2 /
MCACOP-8

1

# View Optimization Opportunities

To Do

## Description

As a Cloud Administrator,
I want to view identified idle resources and estimated savings,
so that I can take action to reduce unnecessary cloud expenditure.

MCACOP-3 /
MCACOP-9

1

# Configure Cloud Budget

To Do

## Description

As a FinOps Analyst,
I want to configure a cloud spending budget,
so that the portal can monitor expenditure against the defined threshold.

MCACOP-3 /
MCACOP-10

1

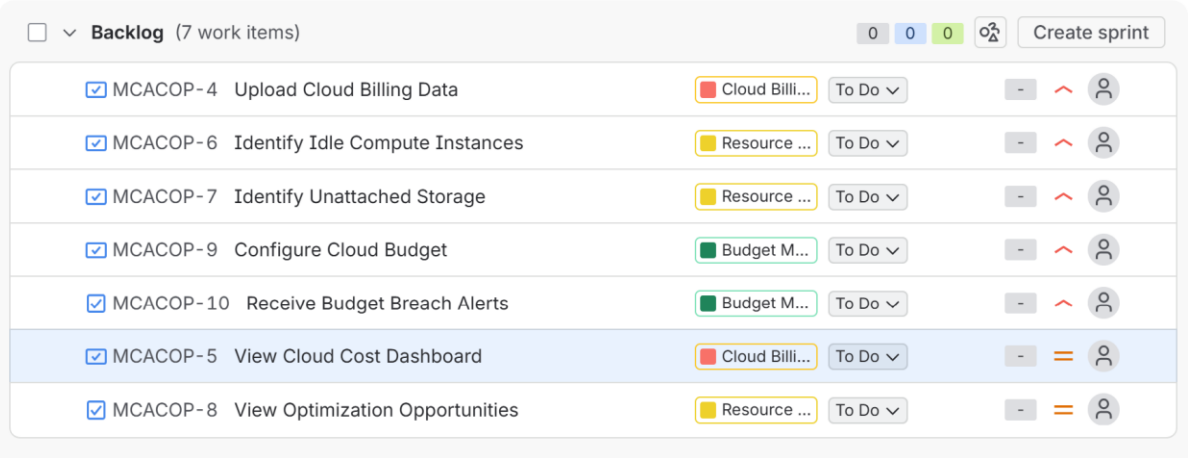

# Receive Budget Breach Alerts

To Do

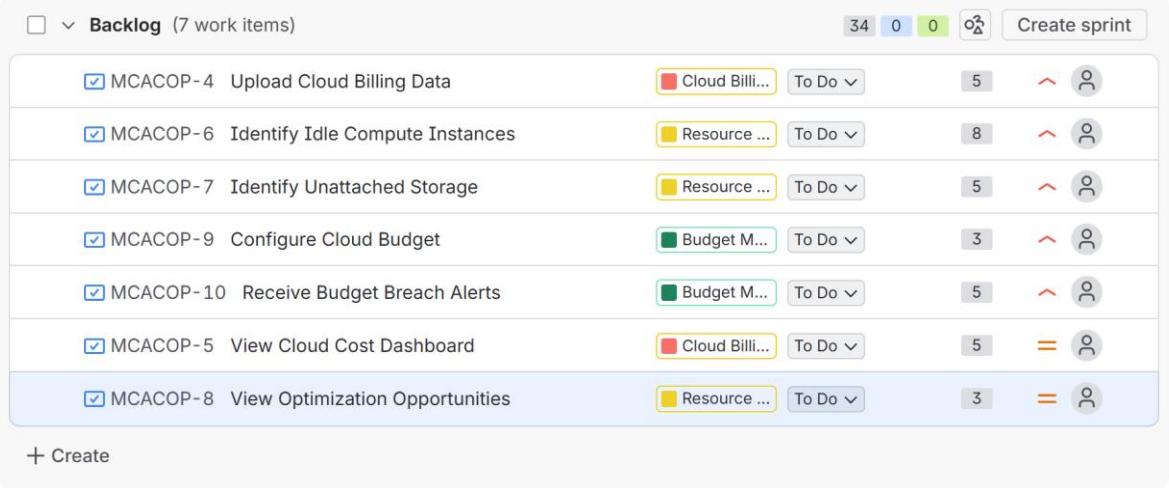

## Description

As a FinOps Analyst,
I want to receive an alert when cloud spending exceeds the configured budget,
so that I can take corrective action before costs increase further.

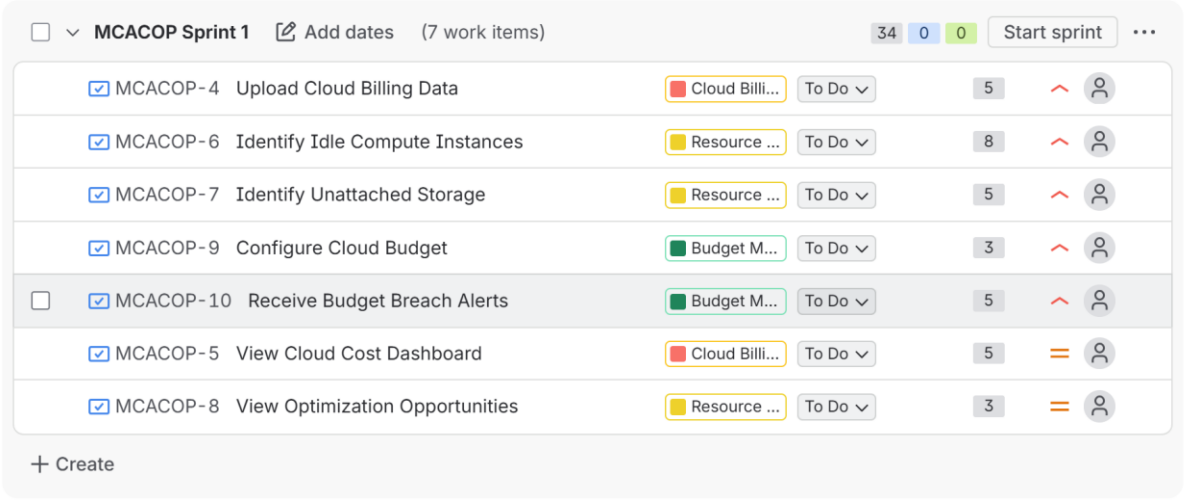

## Prioritisation:

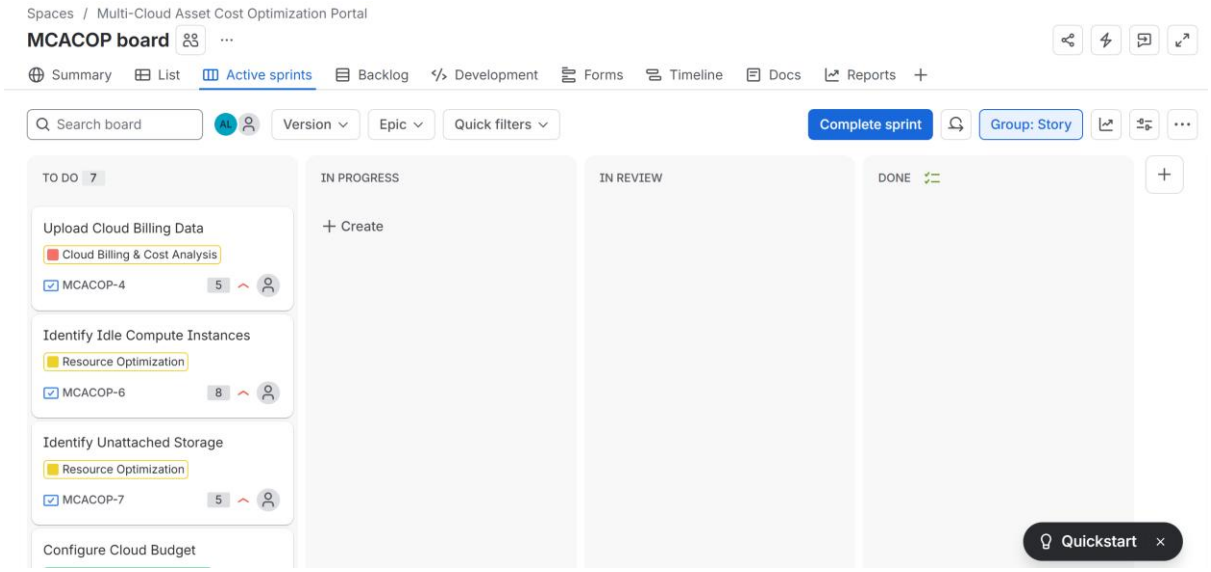

# Adding Story Points:

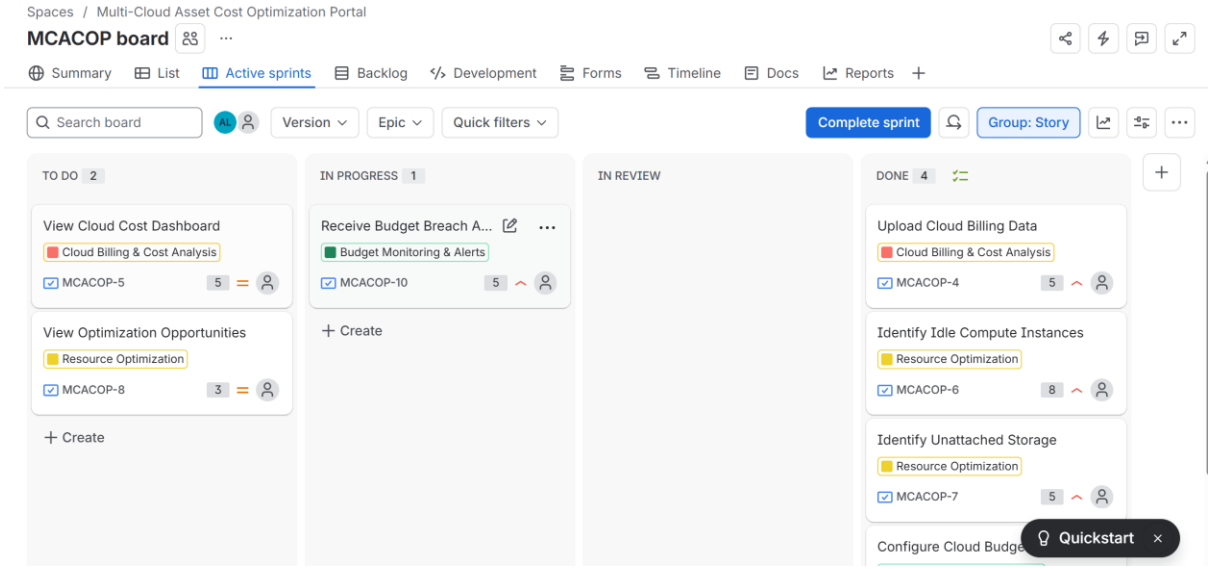

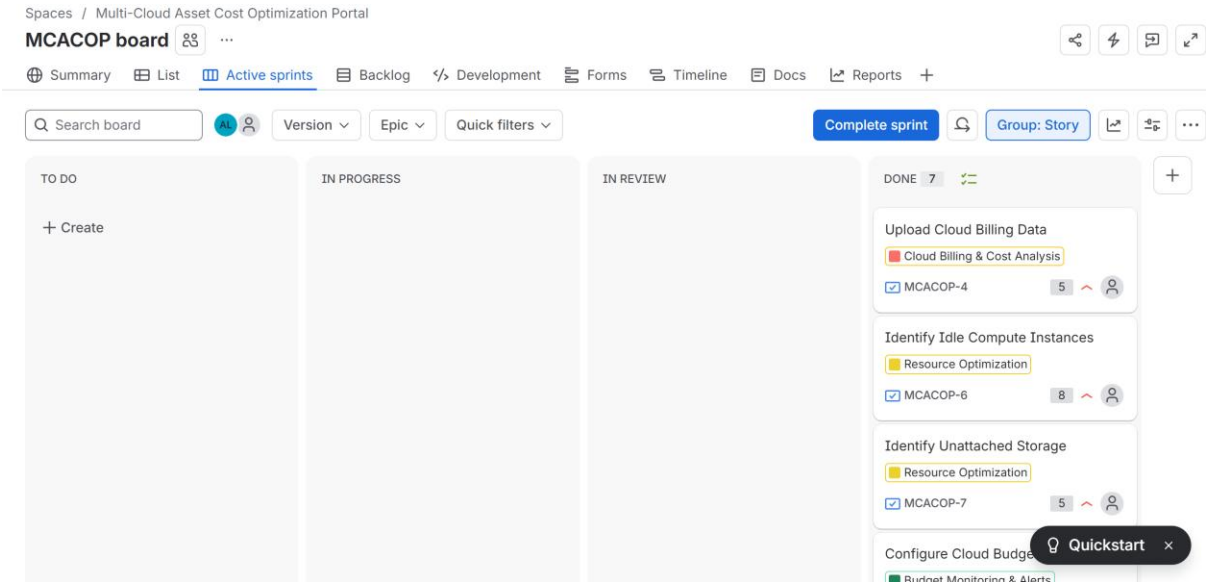

# Sprint:

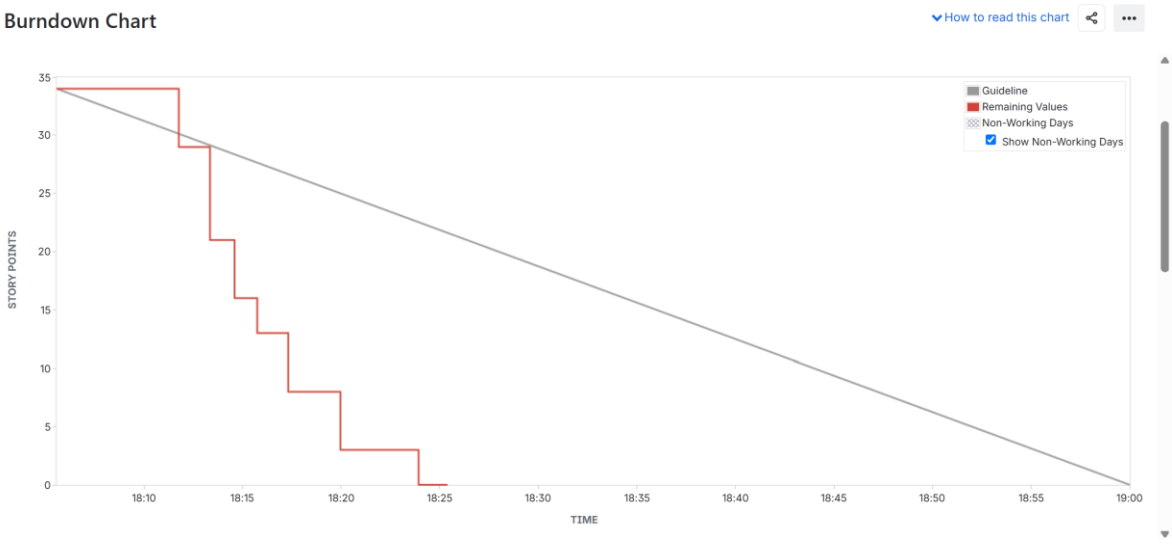

# Sprint Board:

## Burndown Chart:

## Reflection Questions:

1. Did your estimations reflect the actual effort?

Yes, our estimations were mostly close to the actual effort required. We used story points based on the complexity and difficulty of each user story. The more complex stories, such

as identifying idle compute instances, were given higher points, while simpler tasks such as configuring the cloud budget were given fewer points. Since all the stories were completed during the sprint, the estimates were reasonable.

2. Was your backlog well-prioritized?

Yes, the backlog was well-prioritized based on the importance of each feature. We placed high-priority stories such as uploading billing data, identifying idle resources, and receiving budget alerts above the less critical dashboard and display features. This allowed the important cost-optimization functions to be addressed first.

3. How did your simulated sprint align with your plan?

The simulated sprint followed our plan successfully. We selected the required user stories, started the sprint with a one-week duration, and moved the stories from To Do to In Progress to Review and finally to Done. All the planned stories were completed, so the sprint achieved its intended goal.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed how our remaining work decreased as we completed the user stories. It helped us understand the team's progress and showed that the planned work could be completed within the sprint. It also demonstrated how story points can be used to track the team's capacity and progress during a sprint.
